DevOps Deployment (AWS)

Built & Deployed a Cloud-Native Microservices Application (React + Spring Boot)

This document brings together the supplied project screenshots for the application, its delivery pipeline and its AWS environment.

Included Screenshots

01 CloudFront Distribution

02 CloudFront Configuration

03 S3 Frontend Bucket

04 Application Load Balancer

05 Load Balancer Target Group

06 Amazon RDS Database

07 Amazon SES Console

08 AWS WAF Console

09 Jenkins Pipeline

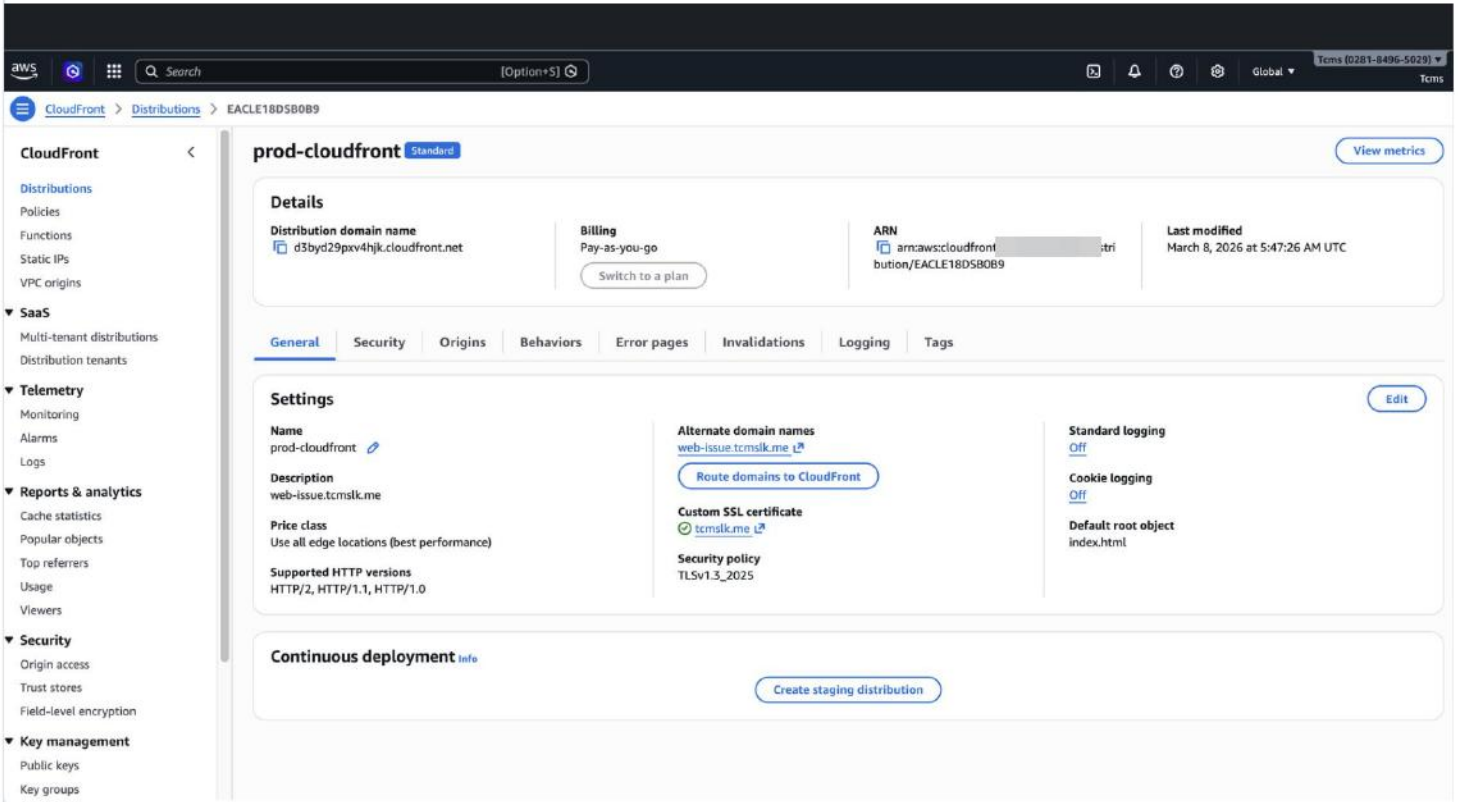

10 Issue Tracker Application

11 Application Network Requests

Prepared by Bawantha Rathnayake

01 CloudFront Distribution

CloudFront Distribution

Amazon CloudFront distribution overview.

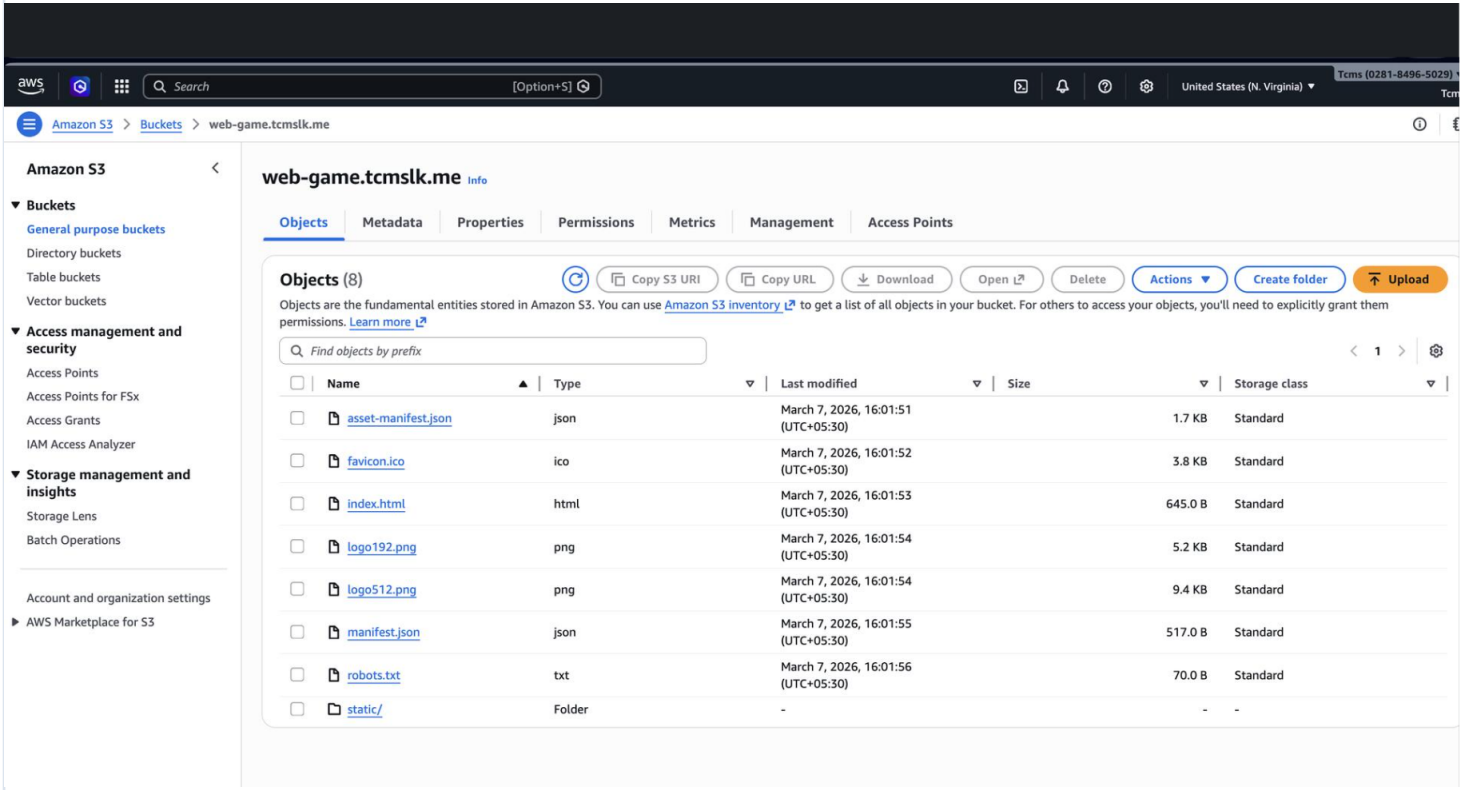

02 CloudFront Configuration

CloudFront Distribution

Additional Amazon CloudFront distribution details.

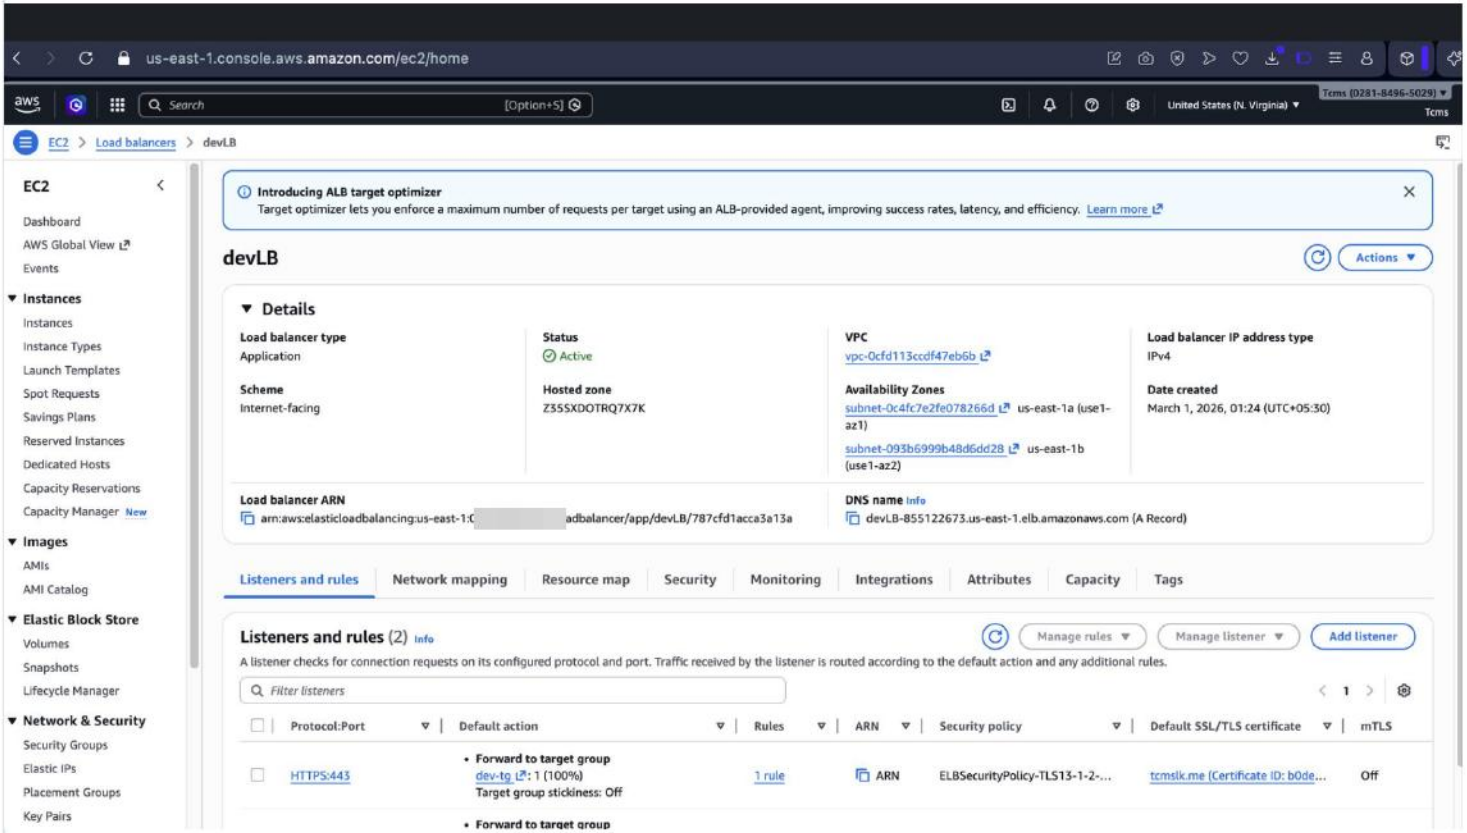

03 S3 Frontend Bucket

S3 Frontend Bucket

Amazon S3 bucket containing the frontend application files.

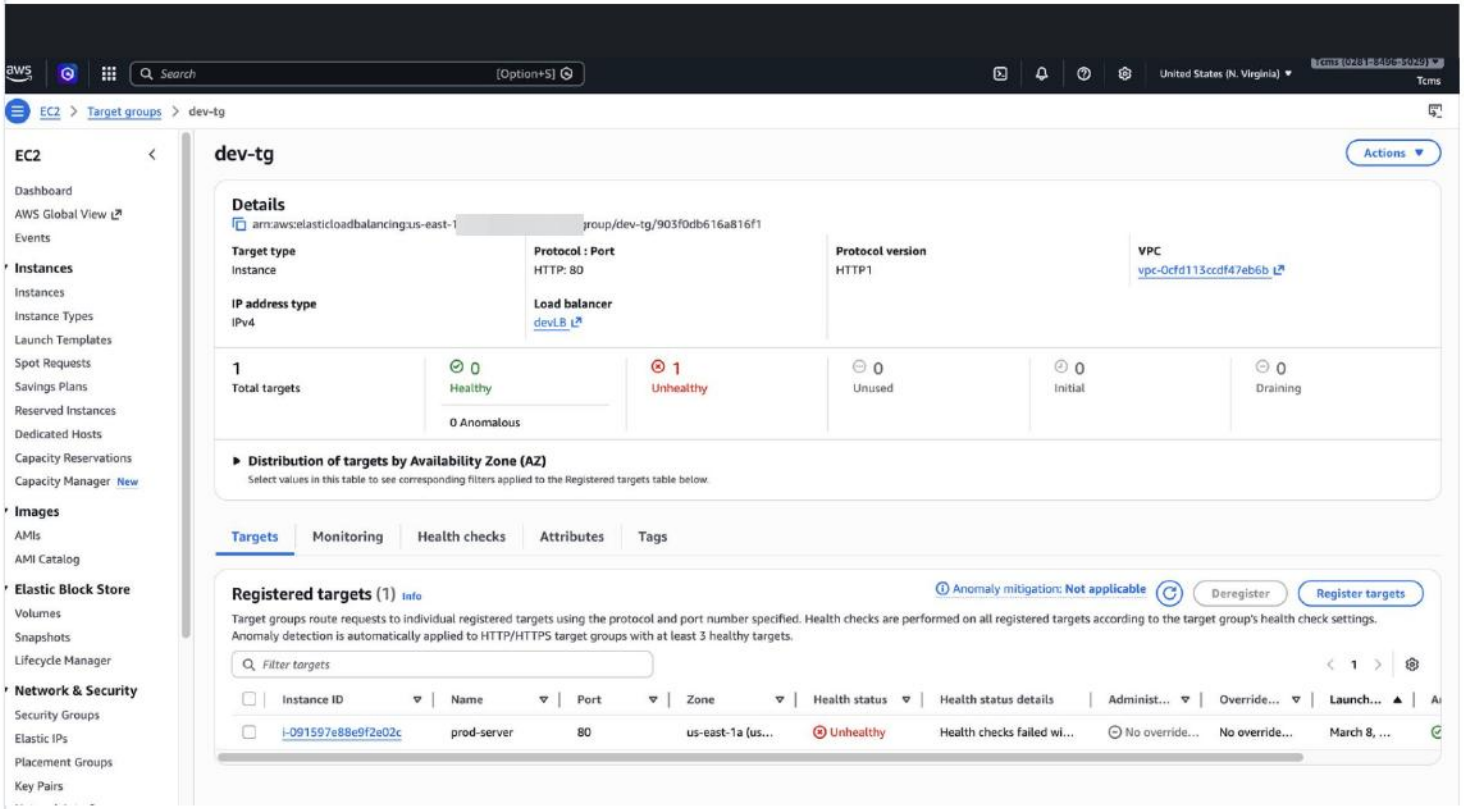

04 Application Load Balancer

ALB
ALB dashboard

Application Load Balancer configuration in the AWS console.

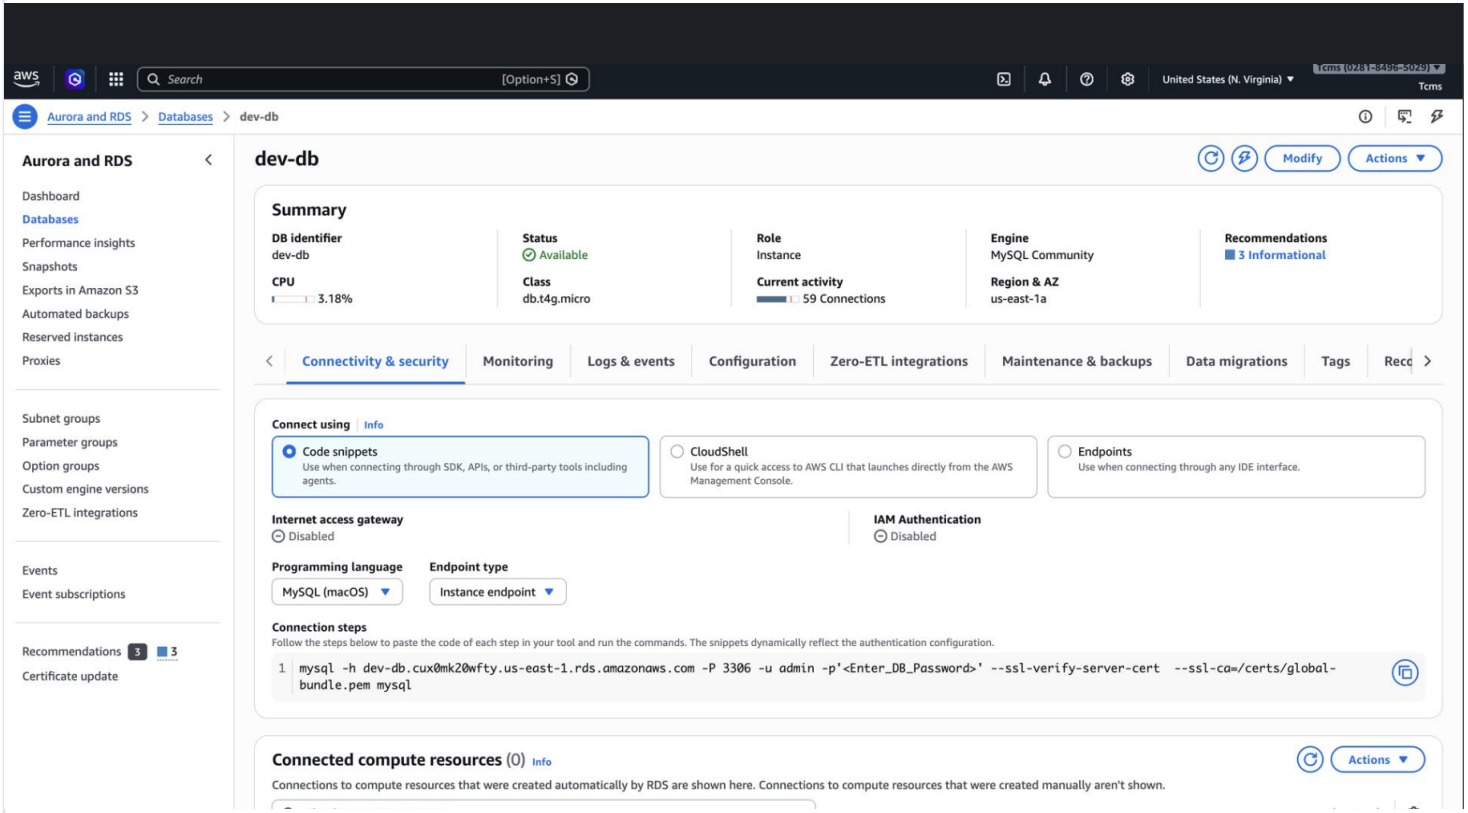

05 Load Balancer Target Group

Target group
Target group for ALB

Target group configuration for the Application Load Balancer.

06 Amazon RDS Database

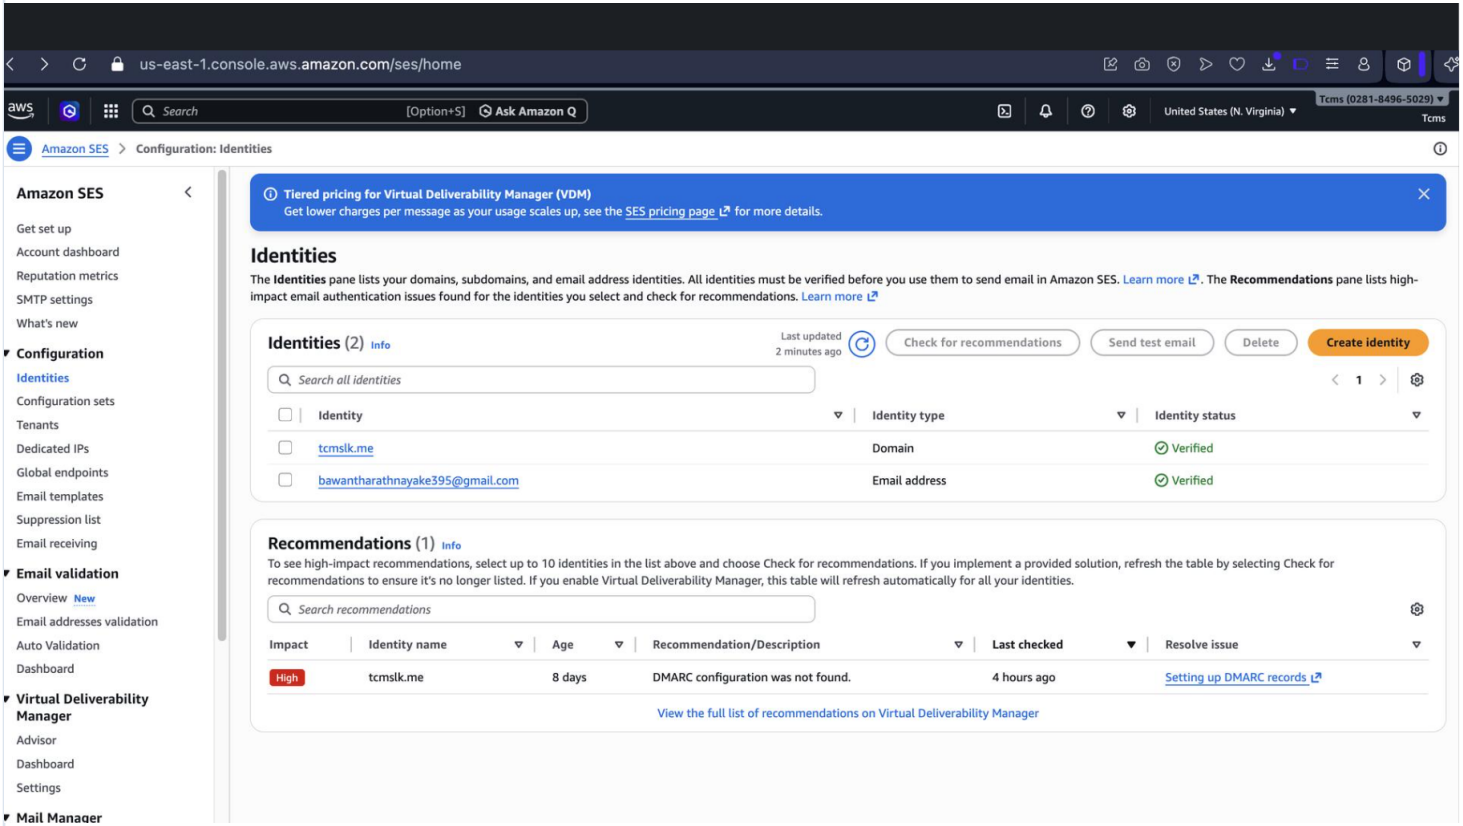

RDS Database

Amazon RDS MySQL used as the managed database.

Amazon RDS console showing the database used by the application.

07 Amazon SES Console

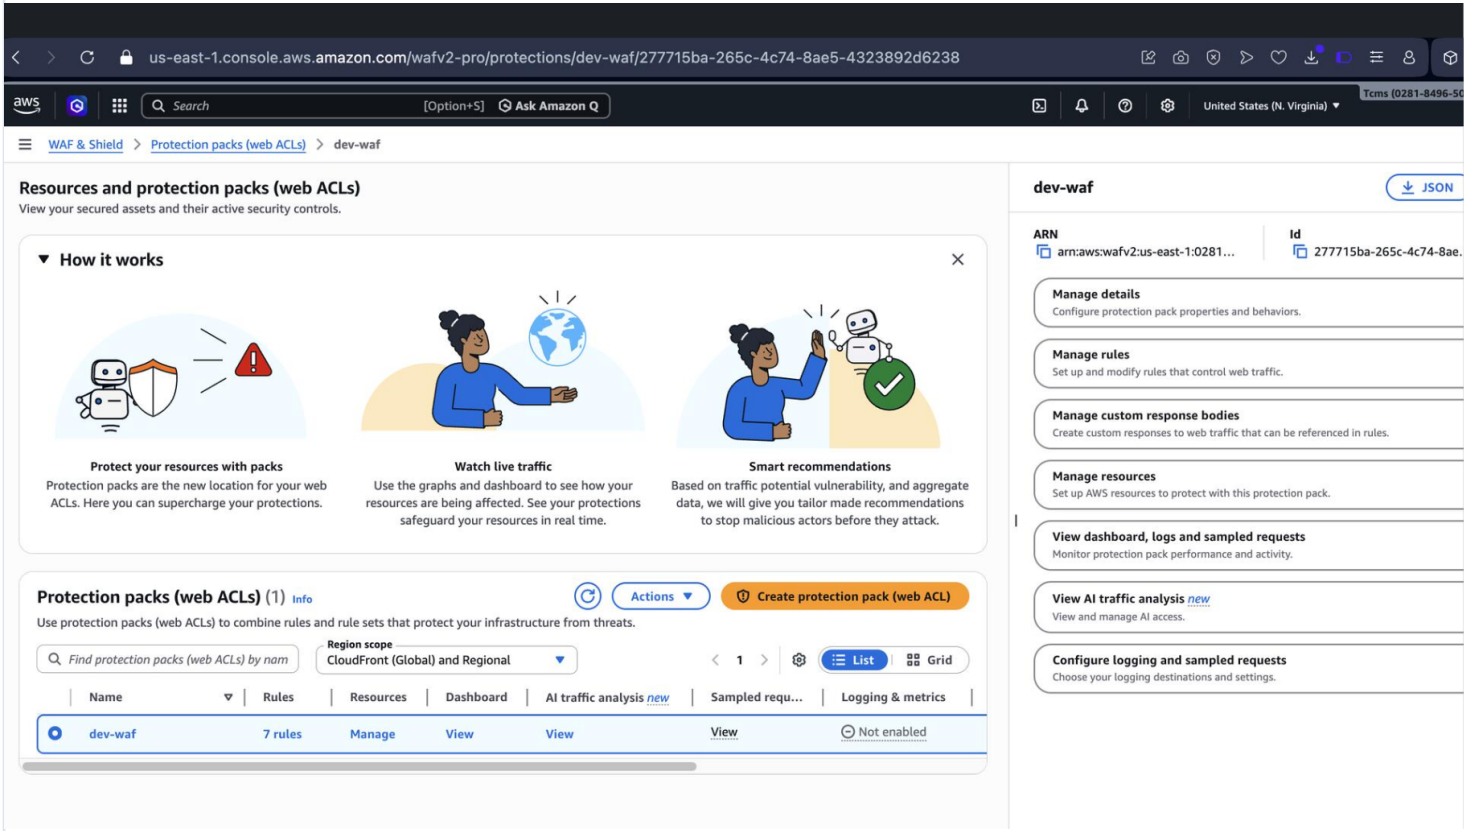

SES Email Setup

AWS SES configured for transactional email delivery.

Amazon SES console for email configuration.

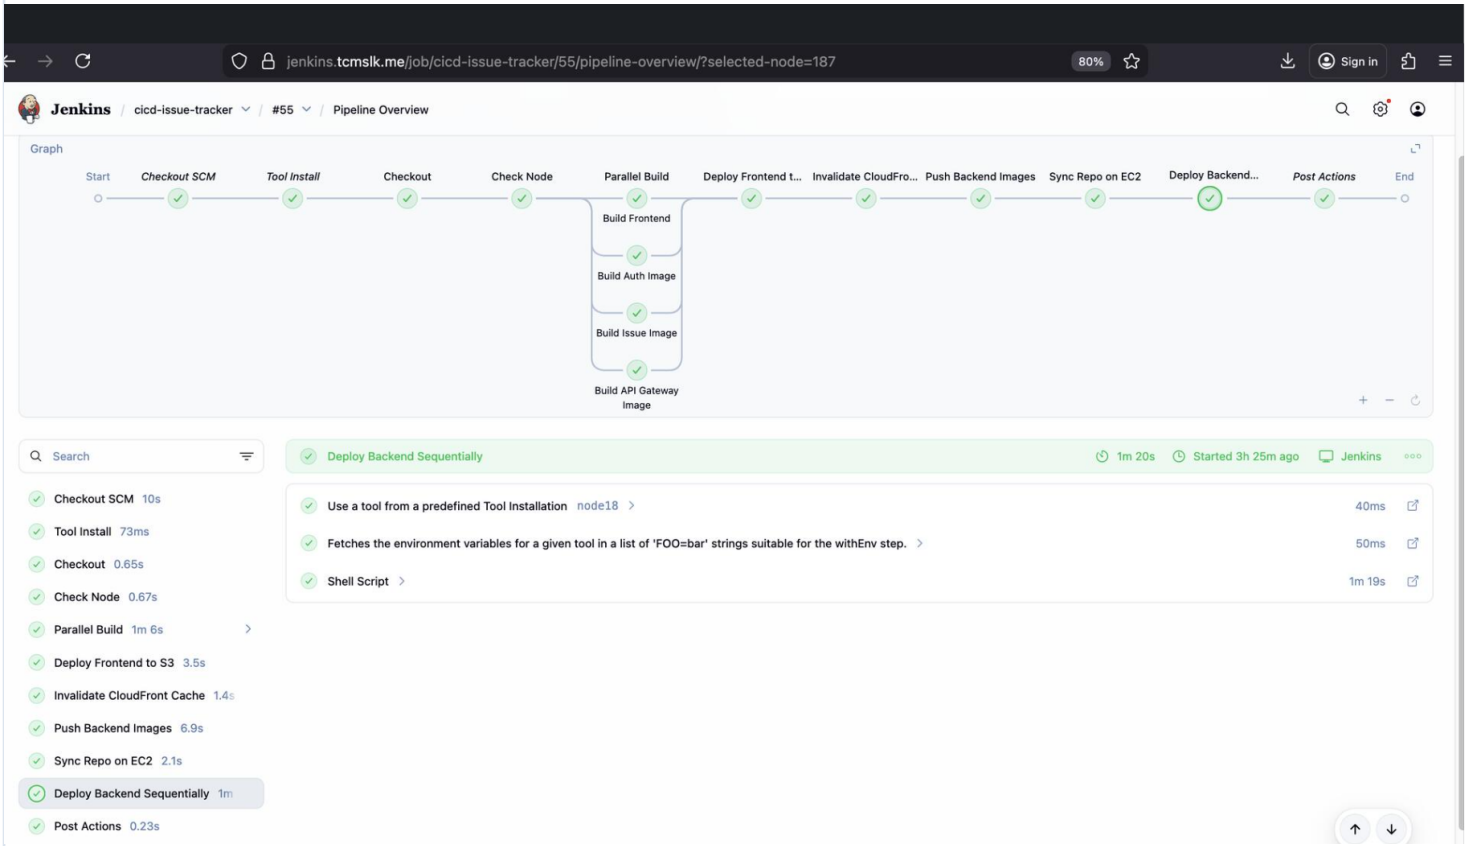

08 AWS WAF Console

WAF

AWS WAF console reference.

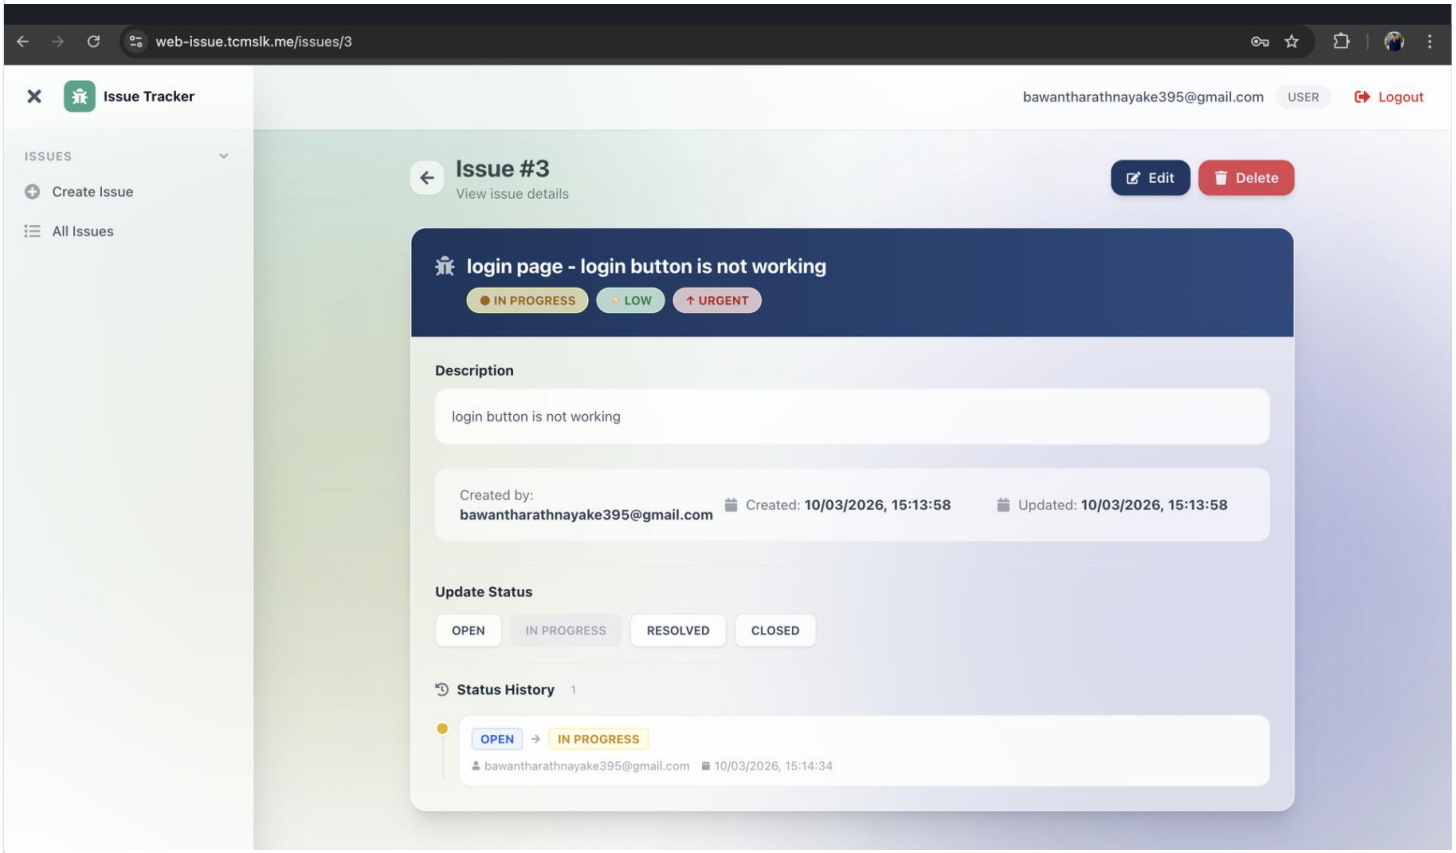

09 Jenkins Pipeline

Jenkins Pipeline

Jenkins pipeline overview for the microservices application.

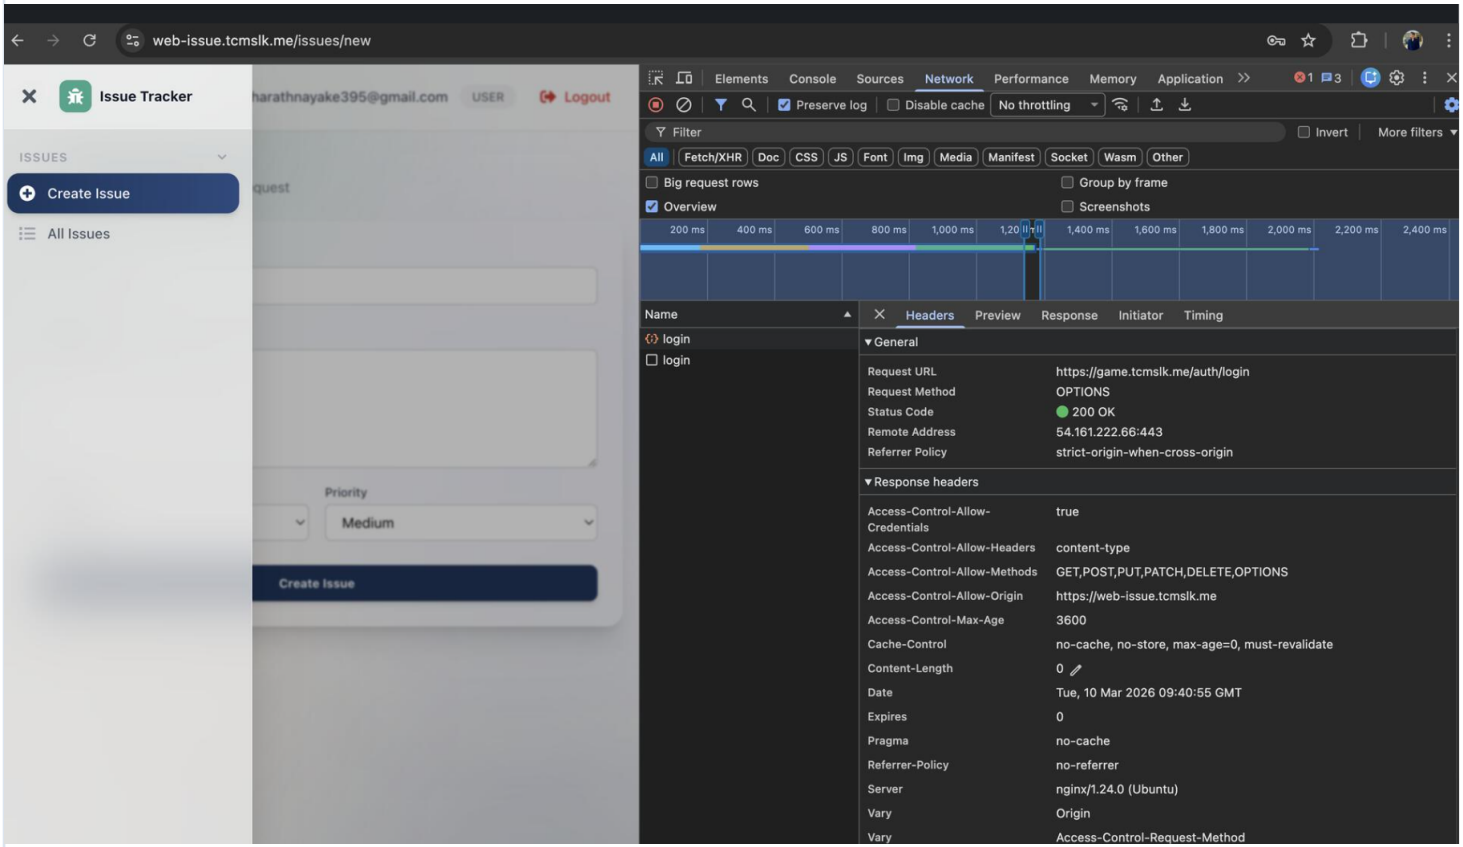

10 Issue Tracker Application

Issue Tracker
Live app is running

Issue tracker application interface.

11 Application Network Requests

Network tab showing requests hitting game.tcmslk.me

Browser network panel showing application requests.
